

Dancer Architecture

Jack Reis's Claude Code Skill Pack Marketplace

5 packs | 26 skills | zero inherited bloat

Architecture Overview

Dancer is a monorepo containing 5 curated skill packs (26 skills total) for Claude Code. The architecture has four layers: (1) Skill Packs -- user-facing units of SKILL.md + scripts + tests; (2) Pack Infrastructure -- package.json, README, REFERENCE.md per pack; (3) Build Pipeline -- scripts that validate, generate, enhance, and sync the marketplace; (4) Fleet Protocols -- cross-pack convergence primitives (dialectic, attestation, A2A).

Functional Areas

1. Athenaeum (Convergence Engine) -- v0.2.0, 4 skills

A streamlined dialectic pipeline for agent convergence. design: propose claims for peer review. reconcile: resolve conflicting claims into merged design. ratify: fleet-wide formal attestation with dissent recorded. audit: 13-branch code-aware agent stack audit with confidence rules.

Internal modules: a2a_rpc.py (JSON-RPC 2.0 server), a2a_task.py (Task/Artifact/TaskStatus model + persistence), agent_card.py (Agent Card generator for ./well-known/agent.json). A2A integration exposes tasks/send, tasks/get, tasks/cancel methods.

2. grill-each-other (Dialectic Claim Discipline) -- v1.3.1, 10 skills

The full dialectic toolkit. Two lineages: Convergence: grill-me > grill-me-agents > grill-me-with-agents > peer-grill > fleet-ratify. Visibility: agent-show-and-tell (status without convergence pressure). Also includes: permutation (NxN topology), dialectic-vocabulary, peer-grill-with-agents, grill-with-docs, caveman, find-skills.

peer-grill core modules: core.py (PeerGrillDialectic engine), dialectics.py (thesis-antithesis-synthesis), consensus_manager.py (multi-agent convergence tracker), state_manager.py (ClaimsStateManager for .peer-grill/state), crypto_utils.py (AttestationManager, SHA-256 signing).

fleet-ratify provides SHA-256 attestation with CLI (fleet_ratify.py) and 2 e2e tests. permutation ratifies NxN relationships with Mermaid + ASCII topology diagrams.

3. autonomous-ai-agents (Fleet Coordination) -- v0.4.0, 3 skills

fleet-identity: declares agent name, role, capabilities, boundaries. hermes-bridge: MCP bridge to Hermes messaging relay. openclaw-bridge: MCP bridge to OpenClaw dispatch system.

4. Leonardo (Protected Strings) -- v1.1.0, 1 skill

A protected-string decoder with rate limiting, deduplication, and Discord audit trail.

Execution flow: main > encode/decode > _gated_tattle > check_ratelimit > check_dedupe > tattle_to_discord (novel) or _dedupe_file (duplicate). Suppressed: fallback_audit.

5. Pocock Engineering (SDLC Skills) -- v1.0.0, 8 skills

Eight SDLC skills forked from Matt Pocock's framework. Pure SKILL.md files with no scripts -- they rely on Claude Code's native tool invocation: zoom-out, diagnose, triage, tdd, to-issues, to-prd, improve-codebase-architecture, setup-matt-pocock-skills.

Cross-Pack Dependencies

No import dependencies exist between packs -- each is fully self-contained. Relationships are protocol-level (shared state directories, compatible file formats).

Key protocol relationships: athenaeum-ratify cascades to fleet-ratify for fleet-wide attestation. athenaeum-reconcile descends from the peer-grill dialectic lineage. athenaeum-design descends from the grill-me lineage. A2A RPC depends on a2a_task and agent_card modules. peer-grill depends on core -> {dialectics, consensus_manager, state_manager, crypto_utils}.

Build Pipeline

validate-skills-schema.py: Validates SKILL.md frontmatter against 2025 schema. skills-generate-vertex.py / skills-generate-vertex-safe.py / skills-generate-gemini.py: Generate missing assets using Vertex AI or Gemini. skills-enhancer-batch.py: Overnight batch enhancement pipeline (main > run_overnight_batch > process_plugin > generate_enhancement_plan > smart_delay > apply_enhancements > backup_plugin). sync-marketplace.cjs: Synchronizes marketplace.json from plugin state. audit-run-full.sh: Runs all validation scripts in sequence.

Key Design Decisions

1. Packs are self-contained

No cross-pack Python imports; protocol compatibility via shared directory conventions

2. 2025 SKILL.md schema

name + description as portable minimum; optional allowed-tools, version, package manifests

3. File-based state

.athenaeum/ and .peer-grill/ directories for durable agent state; A2A is additive overlay

4. athenaeum-audit as 4th skill

Audit is a standalone protocol, not a mode of design

5. agent-show-and-tell in grill-each-other

Visibility != convergence; different lineage

6. dialectic-vocabulary as reference

Absorbed into REFERENCE.md section 10, not a standalone skill

7. fleet-ratify ratifies artifacts

SHA-256 attestation for nodes (decisions, ADRs)

8. permutation ratifies edges

NxN topology diagrams for agent relationships

9. Leonardo rate limiting + dedup

Prevents Discord audit spam via `_ratelimit_file` and `_dedupe_file`

Fleet Directive

All agents working in this repo follow the Fleet Directive -- Durable Evidence: Done = artifact + path + verification + commit + push + caveats. If the next observer cannot find it, the agent did not finish it.

This architecture document is part of the fleet map -- every agent can orient to this file to understand identity, role, peers, and project state.
